

9000 SERIES CULTIVATOR

Increase your net yield!

Immediate return on investment.

Spudnik cultivation program provides:

- Significant reduction of green potatoes.
- Minimal wind and water erosion.
- Maximum in weed control.
- Significant clod reduction.
- Improved frost control.
- Increased moisture retention.
- Very even, high volume hills.
- Cultivation pre- and post emergence.
- One pass cultivation.
- Increase your net yield by several percent.

AGRONOMICS

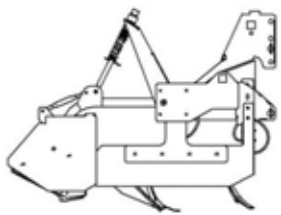

Spudnik worked hard to design a machine that operates with an efficient cultivation facilitating an immediate return on your investment. Spudnik's 9000 series cultivator does exactly that for you! Our cultivator provides versatility never before seen in potato cultivation which will give you results that are astonishing as much as they are revolutionary.

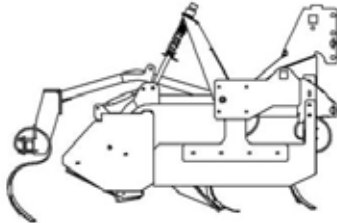

Cody Easterday, Basin City, Washington

"With the Spudnik 8-row hillers our digging conditions improved drastically over our previous hilling program. The consistent shape of the hills allowed us to dig with a significant improvement, and with much higher bruise-free digging than we have had in the past. I really like my Spudnik hillers!"

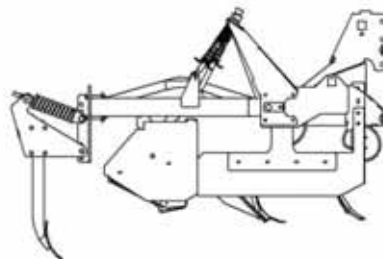

APPLICATIONS

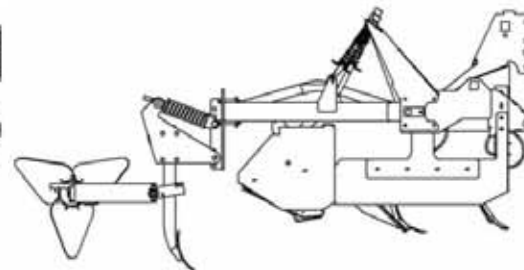

Standard hiller with an adjustable row width of 32" to 38". Four, six and eight row models available.

Hiller/Ripper combination kit: a set of loosening tines are mounted on a light toolbar behind the shaping boards in order to loosen up the furrow after hilling, especially in tractor tracks.

Hiller/Shank combination: a set of heavy duty straight shanks with rock protection is mounted on a heavy toolbar behind the hiller. Straight shanks enable you to work your ground up to 15" deep! Ideal combination if you want to achieve an optimal moisture penetration between rows.

Hiller/Prop combination: this is the ideal cultivator in irrigated as well as non-irrigated fields. A complete set of heavy duty straight shanks and props are mounted on a heavy toolbar behind the hiller. This unit enables you to work your soil up to 15" deep. The prop paddles penetrate the soil up to 15" as well. They create water reservoirs with the deepest and largest volumes in the market.

High versatility. Easy operation.

VERSATILITY

To have an effective cultivator it needs to fulfill three requirements: work soil, form hills the way you want, and create water reservoirs in the furrow. The 9000 series cultivator is the first in the market to possess these attributes altogether.

Jay Miyanaga, Taber, Alberta

"This product gives us uniform and sculptured hills. Also, the paddle and shank assembly allows us to stop erosion while holding moisture in the pockets for the plants. Ultimately it allows two operations in one pass while working at ground speeds that allow us to increase productivity."

- HD S-tines and vibro shanks loosen and agitate the soil.
- Different points are available upon request.

- HD straight shanks with effective individual rock protection enable you to work your ground up to 15" deep.
- Large and deep dikes hold the highest volume of water available in the market.

- Quick adjustment of shaping boards.
- Individualize your fields by determining the height and width of your hills in seconds!

- Spudnik's all new "quick adjust" for the front row vibro shanks enables you to change the set-up of your cultivator in seconds!

- The optional gauge wheel is recommended in case the float function on your tractor's three point hitch does not work reliable.

- Working pressure adjustment is simple and quick with Spudnik's shaping board and toolbar.
- With our spring-loaded shaping board and toolbar serving as rock protection, this unit is virtually indestructible!
